Description

Properties	Values
Name	DebugtMapErrors
Author	Joshi, Nishad
Version	1.0
Purpose	
Status	DEV
Description	
Creation	6 Jun, 2016 4:03:03 PM
Modification	2 May, 2018 2:33:52 PM

Preview Picture

You create a job with a tMap and it fails due to some problem in the tMap config. Many times it is due to something connected to data being null. Maybe you have a "compareTo" checking a String that is null or a "parseInt" trying to convert some non numeric text to an Integer. They are common issues, but they are generally pretty tricky to identify so that you can cater for situations in which they occur.

When you use a tMap component, by default it is set to die on error. So if there is an error with processing data, the job will die and you will receive a Java runtime error (like a NullPointerException). However, this does not pinpoint where the error occurred (without digging through the error stack) and certainly doesn't tell you the data that caused the error. However, this does not need to be case. You can set the tMap to not die on error and to actually have an output specifically for errors.

In the top left corner, there is a button. Press this and it will reveal the Property Settings window. Untick the "Die on error" tick box. This will reveal a new output for the tMap with pre-configured columns for "errorMessage" and "errorStackTrace". Now whenever there is a Java runtime error caused by the tMap, you will get an error that will not kill the job.

On its own, this isn't much help. To add value to this, you will need to add all of the columns that you are processing to the error output. Then when an error occurs, you will log the datarow that caused it.

Settings

Extra settings

Name	Value
