Sorts input data based on one or several columns, by sort type and order. Sorting happens in Memory using default settings.

Sort on Disk option available in Advanced settings

Customize the memory used to temporarily store output data.
 Temp data directory path: Set the location where the temporary files should be stored.
 Create temp data directory if not exists: Select this check box to create the directory if it does not exist.
 Buffer size of external sort: Type in the size of physical memory you want to allocate to sort processing.

As input component, a NYSE file contains stock prices and volume to be sorted by stock symbol in descending order. The output flow goes to tLogRow.
